Statement of Purpose

I started programming at an early age, driven by a genuine curiosity about how things work behind the scenes. Over time, this interest grew into a deep passion for building thoughtful, well-structured software. I began exploring everything from classic programming languages to more modern tools and frameworks, gradually finding my focus in creating **clean**, **scalable**, and **maintainable systems**.

Along the way, I developed a strong interest in **software design and architecture**. Concepts like **clean code**, good structure, and maintainable systems became more than just practices — they became **principles I truly care about**. I've spent a lot of time reading, experimenting, and learning about design approaches that make software easier to understand, improve, and scale.

To summarize myself into a minimum set of attributes I would say I'm a continuous learner who hugely values technical quality. So, a job position with lots of learning opportunities and a never-ceasing attention to technical quality makes the ideal work that I could imagine. Due to this mindset, I think, I'd be a better fit for companies/projects where their products are software platforms/systems/tools that empower other businesses.

Currently, I work as a **full-stack developer**, primarily using **JavaScript**, **TypeScript**, and **Node.js** on the backend, along with modern frontend frameworks like **Vue** and **React**. In the coming months, I plan to **relocate to Finland** and look forward to bringing my experience and enthusiasm for thoughtful software development to a new environment.

Sincerely,
Pedram Soofi
